

Intervention IP-122: Ending the transmission of HBV from the perinatal period throughout the lifespan (abbreviated as “END B”)

Summary

The END B intervention was designed to prevent chronic Hepatitis B (HBV) transmission and improve health outcomes among Asian populations (age 1-18+), focusing on addressing health disparities. The intervention enhanced HBV screening and prevention through in-person education sessions, culturally tailored materials (e.g., brochures and PowerPoints), and patient navigator follow-ups. The intervention increased HBV screening rates and improved knowledge among participants, and its effectiveness was highlighted in three PubMed-indexed publications.

Overview

Purpose of Intervention:

The purpose of the END B intervention is to spare the next generation of Sacramento patients enrolled in the Health and Life Organization (HALO) from preventable hepatitis B infection.

Intervention Type:

Advanced — Pilot, demonstration or feasibility interventions with adequate methodological rigor that have demonstrated short-term or long-term positive effects on one or more targeted outcomes to improve minority health and/or health disparities through quantitative measures; Studies have a comparison group and are published in a peer-review journal.

Intervention Details

Intervention was Primarily Driven, Led, or Managed by:

Academic/Clinical Researchers Only

Office of Community Outreach and Engagement, UC Davis Comprehensive Cancer Center, Sacramento, CA

Intervention URL:

Not available

Results

Intentions

Improve minority health or the health of other populations with health disparities (e.g. rural populations, populations with low SES)

Intervention Primary Outcome:

Prevention perinatal HBV transmission

Intervention Secondary Outcome:

Increase screening for HBV

Key Findings:

As a result of early adoption of telehealth services at HALO during the COVID-19 pandemic, completion of HBV testing among pregnant women at HALO remained only slightly below prepandemic levels. Use of an EHR-based registry of high-risk patients across all HALO clinics led to a large increase in the number of tests completed and new HBV cases detected. For example, 19 new HBV diagnoses were found within 6 months of use compared with 3 in the 6 months prior to initiating registry-based testing. All of these patients were linked to the care of a hepatologist.

Statistical Method Used:

Descriptive statistics

Was statistical method used to analyze data from original Intervention comparable to the original:

Yes

Evaluations and Assessments

Were Any of the Following Assessments Conducted (Economic Evaluation, Needs Assessment, Process Evaluation)?:

No

Demographic and Implementation Description

Diseases, Disorders, or Conditions:

Hepatitis B

Race/Ethnicity:

Asian

Populations with Health Disparities:

People with Lower Socioeconomic Status (SES), Racial and Ethnic Minority Populations

Age:

Young Adults (18 - 39 years), Middle-Aged Adults (40 - 64 years), Older Adults (65+ years)

Socio-demographics / Population Characteristics

Community Type:

Urban / Inner City

Other Populations with Health Disparities:

Unspecified

Geographic Location:

California, Sacramento

Socio-Economic Status:

Low SES, Middle SES, High SES

Characteristics and Implementation

Intervention Focus Area:

Behavior Change

Disease Continuum:

Secondary Prevention

Delivery Setting:

Clinic / Health Care Facility

Mode of Delivery:

In-person

Who delivered the Intervention?:

Healthcare Professional (Physician, Nurse, Technician)

Conceptual Framework

Intervention Theory:

None

Intervention Framework:

None

Implementation

Intervention Study Design:

Non-comparative/non-experimental (no comparison or control groups, pre and post test intervention outcome assessments, single group design)

Targeted Intervention Sample Size:

5004

Actual Intervention Sample Size:

2521

Start Year:

2020

End Year:

2023

Intervention Exposures**Duration of Intervention/How Long it Lasted:**

2-3 years

Frequency of Intervention Delivery:

Once

Number of Sessions/Meetings/Visits/Interactions:

1-2 Sessions

Average Length of Each Session/Meeting/Visit/Interaction:

Less than 1 Hour

Format of Delivery:

Individual

Highest Reading Level of Intervention Materials Provided to Participants:

Unspecified

Adaptations and Modifications

Impact, Lessons, Components

Produced an impact or change beyond the primary or secondary outcome:

Not Tested

Essential Aspects for Success:

Trust and leadership. Educational sessions, content, and materials on HBV were conducted/created in English and Hmong.

Intervention Impact:

Not available

Lessons Learned

Key Lessons Learned and/or Things That Could be Changed or Done Differently:

The success of the project required trust and adaptation. For example, in-person meetings were adapted during the COVID-19 pandemic to virtual meetings. Engagement of some primary care providers in training was low, so the HALO Case Manager and HALO medical assistants were trained in HBV prevention and control. Recommendations were made for newborns to receive their first HBV vaccination within 12 hours of birth, and for the completion of vaccinations for HALO patients, ages 18 and younger.

Insights Gained During Implementation

No insights available.

Intervention Components

Intervention Has Multiple Components:

Yes

Assessed Each Unique Contribution:

No

Products, Materials, and Funding

Expertise, Partnerships, and Funding Sources

	Used for Implementation	Needed for Sustainability
